Got it. Let me ping Engineering and will get back to you. Thank you, team!

Jae

Thank you Jae! I love this approach and think it allows us to highlight the strength we bring to the partnership by having ties to Adobe engineering. We need to instill confidence in our tech and team if we are to secure follow on work.

Hi Team, I am speaking pre-maturely but I might have an idea. Why not have Engineering actually do the Pilot to demonstrate the capabilities at \$0? It will alleviate concerns of being a "guinea pig as a test case" but also confidently show that we can stand it up. It won't replace their site but will be minimal key pages and functionalities to prove our point.

Thoughts?

Team —

Quick heads up: TFS is not turning green. Given the time and the impact, we may need to consider moving it to red.

A few minutes ago Michael Caputo sent a formal email — cc'd to Keith Hunter and their full digital leadership team — pushing back on the DA Live recommendation. Their team met this morning and got to full consensus on 12 specific objections: DA maturity, MSM complexity, authoring overhead, governance gaps, and a real concern that they're being set up as an enterprise-scale early adopter on a platform that isn't fully baked yet. These are all areas that we felt like we addressed, it is clear from their feedback that they have a different view.

The window is tight. Keith is out next week, which means we need to get a meeting on the books with their team before Friday - Sajesh will get this scheduled ASAP.

The email is measured and professional. What they're saying, basically, is "stop advocating for DA and start helping us make a real decision." That is not the "this is our recommendation" approach that we have taken, and requires us to come back with a balanced comparison of DA Live vs. AEM JCR + EDS that takes their actual operating environment into consideration. 200 content authors. Complex MSM hierarchy. Hundreds of web requests a day. The SDD as it stands doesn't address any of that head-on, because we wrote it from a prescriptive standpoint.

The thing I need to take back to the delivery team is: do we defend the DA recommendation with better evidence, or do we reframe around a multi-option framework? Everything else — who we bring, what we prepare, how we structure the meeting — flows from that.

I am also very concerned about what this means for hours, as we are at the end of an already significant free work request.

The SOW is also at risk. They flagged it explicitly.

Full email from Michael is below.

— Dusty

Subject: TF AEM Migration Approach Discussion Requested

EXTERNAL: Use caution when clicking on links or opening attachments.

Adobe Team,

Ahead of next week's Solution Design Document (SDD) readout and recommendation session, we wanted to share some feedback and alignment from our internal stakeholder discussions to ensure we are entering the conversation with clear expectations and a shared understanding of what Thermo Fisher is looking for from this engagement. We are requesting a meeting to discuss with the team on this email by the end of this week, since Keith will be out next week, we don't want to delay.

First, we appreciate the time and effort the Adobe team has invested throughout discovery and the initial SDD review process. We value this partnership and want to ensure the

recommendations presented are grounded in what is truly best for ThermoFisher.com from both a technical and operational perspective.

As we have communicated throughout the engagement, our team is not yet fully sold on Adobe DA Live as the sole or assumed direction for our future-state architecture. While we understand Adobe's enthusiasm around DA Live and recognize its potential benefits, our expectation is that all viable options remain objectively evaluated and, on the table, including but not limited to: AEM JCR on AEM Cloud with EDS, Adobe DA live with EDS.

Our internal team met this morning and is fully aligned that we need a balanced recommendation framework that clearly outlines the pros, cons, risks, operational impacts, governance implications, authoring experience considerations, scalability, and long-term sustainability of each approach.

A key concern for us is ensuring we are not simply optimizing for the easiest technical migration path while unintentionally shifting significant complexity and operational burden onto governance, training, intake management, and content authoring teams post-implementation.

Thermo Fisher operates at significant scale. As a centralized corporate web team, we support hundreds of web requests daily, in addition to supporting approximately 200 content authors across the organization. Any recommendation that materially changes authoring workflows, governance processes, intake structures, publishing models, or training requirements will have substantial organizational and operational implications that must be fully understood and planned for in advance.

If Adobe ultimately recommends DA Live as the preferred path, we need:

- Clear and well-documented reasoning behind that recommendation
- Transparent comparisons against alternative approaches
- A detailed understanding of the organizational impact
- Visibility into governance and operational tradeoffs
- Realistic expectations around change management, enablement, training, and adoption efforts
- An understanding of how workflows and intake processes would need to evolve to align with the platform's capabilities and constraints

We want to ensure the recommendation is being driven by what is genuinely the best fit for Thermo Fisher's business model, governance structure, scale, and operating realities, not simply because DA Live is the newest offering or because it simplifies aspects of the technical upgrade effort.

To be candid, there is also some concern internally that Thermo Fisher may effectively become an early large-scale adopter or "guinea pig" for DA Live within a highly complex enterprise environment. That naturally increases our need for diligence, transparency, supporting evidence, and clear articulation of both benefits and risks.

Our expectation from Adobe as our partner is not advocacy for a single predefined outcome, but rather thoughtful guidance that helps us make an informed enterprise decision with full visibility into the tradeoffs involved.

Below is a detailed list of the areas where we need additional clarification and discussion:

- **Lack of clarity on the practical differences between AEM DA and AEM JCR approaches**
 - We still do not feel we have received a clear side-by-side comparison of DA vs JCR capabilities, tradeoffs, implementation implications, and operational impacts specific to Thermo Fisher's environment.
 - The current recommendation appears heavily weighted toward DA without sufficient detail on what functionality or workflows would differ under a JCR-based approach.
- **Uncertainty around why DA is being recommended over AEM JCR**
 - We would like clarification on whether DA is being recommended because:
 - AEM JCR technically cannot support our MSM hierarchy and use cases, or
 - Adobe's long-term product investment roadmap is simply focused on DA going forward.
 - Our understanding is that an AEM JCR backend should still technically support our existing MSM structure with Edge Delivery Services and Universal Editor overlays.
- **Concerns regarding maturity and readiness of the DA platform**
 - Several of the proposed capabilities appear to still be under active development.
 - Adobe indicated that certain required MSM-related functionality would need future product enhancements before becoming available out-of-the-box.
 - This creates uncertainty around implementation timelines, delivery risk, and dependency on unreleased functionality.
- **Significant concerns around loss of component-level inheritance**
 - Our current operating model relies heavily on component-level inheritance and localized component overrides.
 - The proposed DA model appears to require breaking inheritance at the page level rather than component level.
 - We need detailed examples and demonstrations showing:
 - How migrated pages would behave when only component-level inheritance exists today.
 - What the resulting authoring model would look like post-migration.
 - How synchronization and rollout behaviors would function in practice.
- **Potential increase in authoring overhead and operational complexity**
 - The team is concerned that the proposed inheritance model could significantly increase content maintenance effort.
 - There is uncertainty around whether localized changes would require managing multiple disconnected page variations rather than controlled component-level overrides.
 - We need better understanding of the long-term operational burden on content authors and regional teams.
- **Lack of clarity around rollout and MSM behavior in DA**
 - It remains unclear how multi-level rollouts, country inheritance, regional variations, and selective synchronization will function in DA.
 - Questions remain regarding:
 - Whether rollout operations will cascade automatically through hierarchy levels.
 - How non-MSM countries and regional structures would be managed.
 - Whether additional manual rollout operations would be required.
- **Governance and workflow concerns**
 - We have concerns regarding how governance controls currently enforced through templates, inheritance structures, and component architecture will function in DA.
 - We need additional detail around:

- Activation workflows
 - Content governance models
 - Approval workflows
 - Template enforcement
 - Guardrails and validation mechanisms
 - “Pre-flight” governance capabilities referenced during discussions
- **Universal Editor capability gaps and readiness concerns**
 - While Universal Editor overlays are being discussed for DA, it remains unclear whether the functionality is equivalent to current AEM authoring capabilities.
 - We need clearer documentation regarding:
 - What can and cannot currently be done in Universal Editor with DA.
 - Differences between Universal Editor on DA vs Universal Editor with AEM JCR backend.
 - Current feature limitations and roadmap timing.
- **Need for detailed migration strategy and resource planning**
 - We need significantly more detail regarding:
 - Migration sequencing
 - Resource requirements
 - MSM node migration handling
 - Redirect handling
 - Technical debt carryover
 - Country and region setup requirements
 - Expected operational effort during migration
- **Concern that Thermo Fisher may become an early adopter / “test case”**
 - Multiple team members expressed concern that Thermo Fisher may be among the first enterprise clients implementing this level of MSM complexity on DA.
 - We need transparency around:
 - Existing customer references
 - Proven enterprise implementations
 - Production-scale examples comparable to our use case
 - Lessons learned from other deployments
- **Request for customer references and implementation examples**
 - We would appreciate the opportunity to speak directly with customers currently using DA in enterprise-scale implementations, particularly where Universal Editor overlays and complex MSM-like requirements exist.
- **Need for pilot/testing approach before final commitment**
 - Given the scale of workflow and governance changes implied by DA, we believe a pilot implementation will be necessary before finalizing migration direction.
 - This should include:
 - Migration of representative page sets
 - Testing of authoring workflows
 - Governance validation
 - Rollout/inheritance testing
 - Regional content management scenarios
 - Operational support model validation
- **Potential impact to SOW, timeline, and scope**
 - We believe the above concerns could materially impact implementation scope, delivery approach, timeline, and associated SOW assumptions.

- We would like to discuss these topics collaboratively before the final recommendation and SOW are finalized.

Thanks

Michal Caputo
